(54) Title: OIL MODIFICATION

(57) Abstract

A pseudo-steady state fractionation of a poly-
morphic fat, resulting in a product which is in a
kinetically stable crystal form is performed in a way
that a σ -value is maintained below 0.5, formula (I)
wherein S_c being: the percentage solids in crys-
talliser at crystallisation temperature, S_E being: the
percentage solids after stabilisation for 48 hrs at exit
temperature of crytalliser.

$$\sigma = 1 - \frac{S_c}{S_E} \quad (I)$$

OIL MODIFICATION

The dry fractionation processes for the fractionation of fats disclosed in the prior art are all based on the use of a system comprising a heat exchanger for the starting oil, a crystalliser for the oil obtained after the heat exchange and a filter press wherein crystals are separated from the liquid components.

Because of the conditions applied during these known dry fractionation processes the products contain large amounts of kinetically unstable crystals. Moreover those known processes require high levels of undercooling, which make the processes difficult to control. As a result of above the products are not optimal for filtering, which results in poor yields and poor separation efficiency.

It would be very beneficial if a dry fractionation could be found, that does not have above drawbacks.

We have conducted a study in order to find out whether such a process could be developed. This study resulted in an economically feasible (semi-)continuous dry fractionation process for the crystallisation of polymorphic fat molecules. Therefore, our invention concerns a process for the crystallisation of polymorphic fat molecules in a pseudo-steady state process, wherein the crystallisation is performed in a dry fractionation system in such a way that the crystal form of the product is a kinetically-stable crystal form, while during the crystallisation a σ -value is maintained below 0.5, preferably below 0.3, more preferably between 0.001 and 0.2, during a period of at least 12 hrs, wherein :

$$\sigma = 1 - \frac{S_c}{S_E}$$

S_c being : percentage of solids in crystalliser at crystallisation temperature;

S_E being : percentage of solids after stabilisation for 48 hours at exit temperature of the crystalliser.

So in order to measure S_E a sample is taken from the crystalliser at time is 0 hrs and kept for 48 hrs at final crystalliser temperature without stirring. At time $t=48$ hours the percentage of solids in the sample is measured by NMR-pulse.

For the measurement of S_C the solids are measured in the crystalliser immediately before material is taken out for pressing.

Time $t=0$ hrs is taken as the point in time where for the first time material is taken from the crystalliser for pressing.

If S_C and S_E are very close it can be, that the values obtained (due to experimental inaccuracy) are such, that $S_E < S_C$, so that σ is negative.

$$\sigma = 1 - \frac{S_C}{S_E}$$

Above process according to our invention is conducted in such a way, that the system is always close to its equilibrium, therefore high levels of the more kinetically stable crystal form are obtained. The process is best achieved by performing a very slow stirring during the crystallisation step. Consequently the crystals are easier to filter and an optimal production in high yields and high separation efficiency can be achieved.

Kinetically stable crystal form being defined as any crystalform that at the process-conditions at steady-state does not change substantially during the process and thus may include the thermodynamically stable crystalform.

Another advantage is obtained by applying our novel process on polymorphic fats. The fats obtained according to our novel process do contain more of the stable β -crystals,

than the products of the conventional processes (which contain far more β' -crystals). Polymorphic fats being defined as fats, that can crystallise in different crystal-forms.

5

The above-mentioned process can be run as a pseudo-steady state process for more than 24 hours, preferably for more than 48 hours, while even a period of more than 60 hours can be achieved.

10

For the above-mentioned process to be carried out, a minimum residence time (τ) of the fat in the crystalliser should be maintained. Suitable residence times are τ of more than 1 hour, preferably more than 4 hours and more preferably more than 12 hours, residence time (τ) being defined as :

15

$$\tau = \frac{\text{Volume of crystalliser}}{\text{Average flow rate}}$$

Average flow rate being defined as: total volume of material taken from the crystalliser during one experiment divided by the total time of the experiment (starting from $t=0$)

20

For the above-mentioned σ -values to be achieved, it is suitable to apply a crystalliser whose volume represents more than 2 times, preferably more than 3 times, more preferably more than 5 times the filling (volume) of the separator applied. Very suitably, crystallisers are applied having a volume of more than 10 m³, preferably more than 30 m³, more preferably more than 60 m³.

25

30

Using the above-mentioned volumes for crystalliser and separator (= filter press) causes (considering the duration of the process) only a limited volume of pre-crystallised oil to be conveyed from the crystalliser to the filter press. This increases the available time for residence of the oil in the crystalliser, thus making it possible, to come very close to the equilibrium-conditions.

35

Because of the above-mentioned condition, the fat separated as product will be in a kinetically-stable crystal form. This means that, when a polymorphic fat of the SOS-type triglycerides is applied, in this fat more than 25%,
5 preferably more than 45%, more preferably more than 60% of the solid fat, can be present in the β -polymorphic crystal form.

Examples of fats that can be suitably applied are fats
10 selected from the group consisting of palm oil, palm oil olein, shea, high-oleic sunflower oil, palm oil stearin, high stearic bean oil, hardened vegetable fat, enzymically interesterified fats, chemically interesterified fats or mixtures thereof.

15 A main advantage of the process according to the invention is that it can be controlled by selecting and adjusting the flow rate, shear rate and temperature only.

20 Typical conditions that can be applied for the dry fractionation of palm oil olein are, e.g. :

temperature of starting oil : 50°C
temperature of oil after heat exchange : < 20°C
25 temperature of oil at the end of crystalliser : < 15°C
temperature of oil in the filter press < 15 °C

flow rate in heat exchanger 6 m³/hr
flow rate in at least one of the crystallisers 3 m³/hr

30 volume of crystalliser 54 m³
volume of filter press 4 m³ (filling volume: 5-7 m³)

So : τ = 18 hours

S_c applied : 20-30%
35 S_E applied : 25-35 %

So : σ = remains between 0.14 and 0.25

Using the above-mentioned conditions, a standard palm oil olein can be split into a top fraction (yield 50 %) and into a bottom fraction (yield 50 %).

- 5 Such a process can be run for 60-70 hours without giving rise to problems of encrustation, slurry stability, polymorphic form or viscosity.

Example I

A dry-fractionated palm oil olein was used as starting material. This oil had an I.V.= 55.9; a solid fat content (NMR-pulse) at 20°C of 5.0 and contained 35.9 wt.% of SOS-
5 triglycerides. (S=saturated C₁₆ + C₁₈-fatty acids: O=oleic acid).

The oil was fractionated by bringing into a crystalliser with a volume of 10 l., which was stirred slowly (10 rpm).

10 The oil was cooled, using the following regime:

1 hr at 50°C

from 50 to 31°C in 9 hrs

1 hr at 31°C

from 31 to 29°C in 2 hrs

15 from 29 to 25°C in 40 hrs

from 25 to 14°C in 11 hrs

from 14 to 13.5°C in 5 hrs

Three pressings were performed. The amounts of materials
20 removed per pressing are shown in table I. After each removal the same amount of starting material was added to the crystalliser as liquid, at 13.5°C.

Pressing conditions were:

25 0-24 bar in 2 hrs (linear increase), followed by 1 hr at 24 bar. Presssing temperature in all experiments was the temperature in the crystalliser at the point in time when material was taken for pressing.

Table I

	#1	#2	#3
Time (h)	0	21.5	45.5
S _C %	23.3	22.2	25.7
S _E %	29.0	29.0	29.0
σ	0.20	0.23	0.11
weight of slurry removed per pressing (g)	455	457	452
τ (over 3 pressings) h	300		
Sep. Eff. in press %	49.6	51.1	50.3
Yield of stearin %	47.5	53.4	54.2
Quality of olein IV NO	64.2 8.6	66.4 5.4	67.6 3.6
Quality of stearin SOS (40h/20°C) N20	52.0 47.6	50.9 47.1	52.0 49.3

Both olein and stearin are of good quality.

Example 2

The stearin, obtained in example I was subjected to a dry
factionation. The following conditions were applied:

volume crystalliser: 10 l
stirrer at 10 r.p.m.
cooling program:
1 hr at 70°C
cooling from 70 to 30°C in 4 hrs.

cooling from 30 to 27.2°C in 4 hrs.

8 hrs. at 27.2°C

cooling from 27.2 to 26.2°C in 33 hrs.

Four pressings were performed. The amounts of materials
5 removed and added per pressing are mentioned in table 2.
The materials added had a temperature of 26.2°C.

Pressing conditions: 0-24 bar in 2 hrs.

1 hr at 24 bar

Press temperature in all experiments was the same as the
10 temperature in the crystalliser at the point in time when
material was taken for pressing.

Table 2

	#1	#2	#3	#4
15 Time(h)	0	24	48	72
S _C %	18.4	19.2	19.0	18.0
S _E %	21.1	21.1	21.1	21.1
σ	0.13	0.09	0.10	0.15
20 weight of slurry removed per pressing g	358	388	368	346
25 τ(over 4 pressings) h	450			
Sep. Eff. in press %	42.6	43.9	44.2	43.1
30 Yield of stearin	58.1	54.1	53.3	54.0
35 Quality of stearin SOS % (40h/26°)N 20	72.0 72.8	73.4 74.9	72.6 75.0	71.8 73.5
Quality of olein SOO	17.5	16.4	16.3	16.0

Both stearin and olein are of good quality.

Example 3

- 5 Example 2 was repeated. However, the σ -value was adjusted to $\sigma = 0.73$ by adding a sufficient amount of the fresh stearin having a temperature of 26.2°C. This was done by adding 1081 g of the fresh liquid stearin to 512 g of the oil # 4 with $\sigma = 0.15$.
- 10 The product after pressing was not good. The above example was continued. However, the temperature in the crystalliser was adjusted to 23.0°C, resulting in an S_c of 19.3% and a $\sigma = 0.09$. The moment material was taken for the press is now the time = 0.
- 15 The resulting product after pressing was again not good, the reason being that although σ was in the required range, the process time was less than 12 hours.

The results can be summarised as follows:

- 20 t= 0 hour at the time we did the pressing with $\sigma = \text{ca } 0.7$
Temp. in crystalliser= 26.2°C
Pressing 0-24 bar in 2 hours + 1 hour at 24 bar.
Temperature in press was also 26.2°C.
- 25 t= 0 hour at the time we did the pressing with $\sigma = \text{ca } 0.1$
Temp. in crystalliser = 23.0°C
Pressing 0-24 bar in 2 hours + 1 hour at 24 bar.
Temperature in the press was also 23.0°C.

30

Table 3

	#1	#2
time (h)	0	0
S_c %	5.8	19.3
S_E %	21.1	21.1
σ	0.73	0.09

35

	weight of slurry removed g	416	360
	τ h	7.5 (3 liter crystalliser)	28 (10 liter crystalliser)
5	Sep. Eff. in press %	18.9	38.2
	Yield of stearin %	59.1	78.5
	Quality of stearin SOS	62.9	64.0
	40h/26°C N20	58.1	59.6
10	Quality of olein SOO	12.6	16.3

In both pressings the quality of stearin is not good. (SOS-levels and N₂₀ are too low.).

15

Example 4

A palm oil stearin with:

IV= 31.8

Slip melting point= 51.3 °C

20

SSS= 33.3 %

was fractionated

Experimental details:

Volume crystalliser: 3 liter

25

Stirrer at 10 rpm

Cooling programme: 1 hour at 70°C

Cooling from 70--> 52 in 1 h

Cooling from 52--> 42 °C in 10 h

30 Four pressings were done. The amounts of material removed and added per pressing are shown in the table 4. The materials added as liquid had a temperature of 50°C, because for else the palm oil stearin is not liquid. Pressing : 0-24 bar in 1 hour, followed by 30 minutes at 24
35 bar. Temperature of pressing was 42°C.

Table 4

		#1	#2	#3	#4

25	quality of olein: SOO	14.6	14.3	14.3	13.9

Both stearin and olein are of good quality.

30 Example 5

Hardened soybean oil, m.pt 39°C was fractionated into 2 fractions (a top-fraction A and an olein-fraction B).

The hardened soybean oil had the following N-values:

$$N_{20} = 68.6$$

$$35 \quad N_{30} = 30.6$$

$$N_{35} = 10.9$$

Experimental details:

Volume crystalliser: 10 liter

40 stirrer at 10 rpm

Cooling programme: 1 hour at 70°C

Cooling from: 70--> 40° in 5 hours

Cooling from: 40--> 33° in 7 hours

- 5 The final temperature is decided by the quality of top fraction A.

Three pressings were done. The amounts of material removed and added per pressing are shown in the table 5. The materials added as liquid had a temperature of 40°C in order to ensure pourability.

Pressing: 0-24 bars in 2 hours+ 1 hour at 24 bar.

Press temperature: 33°C

15

Table 5

	# 1	#2	#3

35 Quality of olein B: N ₂₀ -N ₃₅	53.3	53.1	51.4

Both A and B are of good quality.

Example 6

A palm olein-fraction, with the following analytical data, was fractionated:

	IV	=	57.5
5	SOS	=	33.5%
	N ₂₀	=	3.9%

Experimental details:

- 10 Volume crystalliser: 220 liter, 200 kg slurry present
stirrer speed: 4 rpm
cooling programme: 1 hour at 60°C
from 60 to 30 in 5 h
from 30 to 25 in 10 h
15 from 25 to 20 in 20 h
from 20 to 15 in 10 h
12 h at 15°C
from 15 to 14.4 in 5 h
- 20 Five pressings were done. The amounts of material removed per pressing are shown in the table below. After each removal the same amount of material was added to the crystalliser as a liquid at 14.4°C.
- 25 The volume of the press is variable between 10 and 50 liter. The press is of the membrane filterpress type.

Pressing profiles

- Pressings 1, 2 and 3 : 0-20 bar in 50 minutes (linear
30 increase) followed by 10 minutes at 20 bar
Pressings 4 and 5: 0-24 bar in 50 minutes (linear increase)
followed by 10 minutes at 24 bar

- Pressing temperature in all 5 pressings was the same as
35 the temperature in the crystalliser at the point in time when material was taken for the pressing. In this experiment: 14.4°C

CLAIMS

1. A process for the crystallisation of polymorphic fat molecules in a pseudo-steady state process, wherein the crystallisation is performed in a dry fractionation system in such a way that the crystal form of the product is a kinetically-stable crystal form, while during the crystallisation a σ -value is maintained below 0.5, preferably below 0.3, more preferably between 0.001 and 0.2, during a period of at least 12 hrs, wherein :

$$\sigma = 1 - \frac{S_c}{S_E}$$

S_c being : percentage of solids in crystalliser at crystallisation temperature;

- S_E being : percentage of solids after stabilisation for 48 hours at exit temperature of the crystalliser.

2. Process according to Claim 1, wherein the process is performed in a pseudo-steady state for at least 24 hours, preferably for at least 48 hours, more preferably for at least 60 hours.

3. Process according to Claims 1-2, wherein the residence time τ of the fat in the crystalliser is more than 1 hour, preferably more than 4 hours, more preferably more than 12 hours, τ being defined as :

$$\tau = \frac{\text{Volume of crystalliser}}{\text{Average flow rate}}$$

4. Process according to Claims 1-3, wherein a crystalliser is applied whose volume is more than 2 times, preferably more than 3 times, more preferably more than 5 times the volume of the separator applied.

5. Process according to Claim 4, wherein the volume of the crystalliser is more than 10 m³, preferably more than 30 m³, more preferably more than 60 m³.

6. Process according to Claims 1-5, wherein the fat is selected from the group consisting of palm oil, palm oil olein, shea, high-oleic sunflower oil, palm oil stearin, high stearic bean oil, hardened vegetable fat, enzymically
5 interesterified fats, chemically interesterified fats or mixtures thereof.

7. Process according to Claims 1-6, wherein the process is controlled by selecting and adjusting the flow rate,
10 shear rate and temperature only.
